

CabWriter 3.1.1 Release Notes – 10-7-2019

New Functionality

1. Updated the CabWriter 3 with CutList Bridge DXF User's Guide. Importantly, I updated the Guidelines and Rules of CabWriter Use section to explain what characters must not be used in creating file and folder names. Using these characters can result in unpredictable behavior. I added a new guideline/rule which I am adding below for your review.

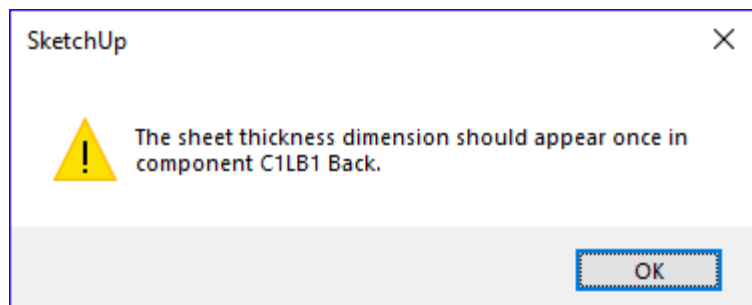

"1. CabWriter uses the model's file name and the names of components to generate folder and file names. In addition, you are sometimes asked to supply a file or folder name, such as when saving a Defaults file.

To ensure the name you supply is valid for use as a file or folder name across all Windows and Mac operating systems and file formats, the following rules must be followed.

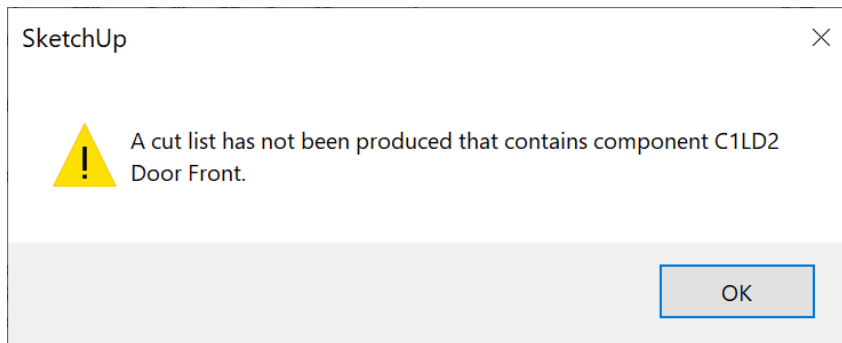

*Do not use these illegal Characters: / \ : * ? " < > | . ^ ,
Avoid using spaces. Instead use hyphen or underscore.*

Here are some specific cases where you must be careful of naming:

- a. When using File > Save As to save a project file for the first time and give it a name. This name is also used to create the Project Name on the CabWriter Settings Project tab.*
 - b. When changing the Project Name on the CabWriter Settings Project tab.*
 - c. Creating a component name, either with Make CabWriter Component or Entity Info.*
 - d. When using the Save CabWriter Defaults to save a defaults file with a user supplied name.*
 - e. Any time you supply a string of characters that will ultimately be used as a file or folder name."*
2. Fixed a problem when printing labels. If Resized Dimensions (RD:) was chosen for any of the five Label Line(s), incorrect result would be displayed.
 3. Fixed a problem where a component had exactly the same bounding box dimension for length and width. When DXF files were called for it would end up in an error similar to that at right.

4. This change might be also filed under Fixes. Changed the menu command File > CabWriter > Create Basic Scene Set to include all layers that contain a CabWriter component(s) in the CutList scene. This means if a component has a CabWriter prefix such as C11LCP Large Island Top, the layer it resides on will be included in the Cut List scene. In the past if for example, Doors & Drawer Fronts were placed on the DXF scene, they were then loft off the Cut List scene and the user would get the following error message when using File > CabWriter Production Documentation.

5. Changed the Draw > CabWriter > Create Section From Section Plane menu command so that the user can select a current section plane, even if it is not the active section plane (a section cut is not displayed), include it with the cabinet(s) selection, and use this command. CabWriter will make the selected section plane active and produce the scene.

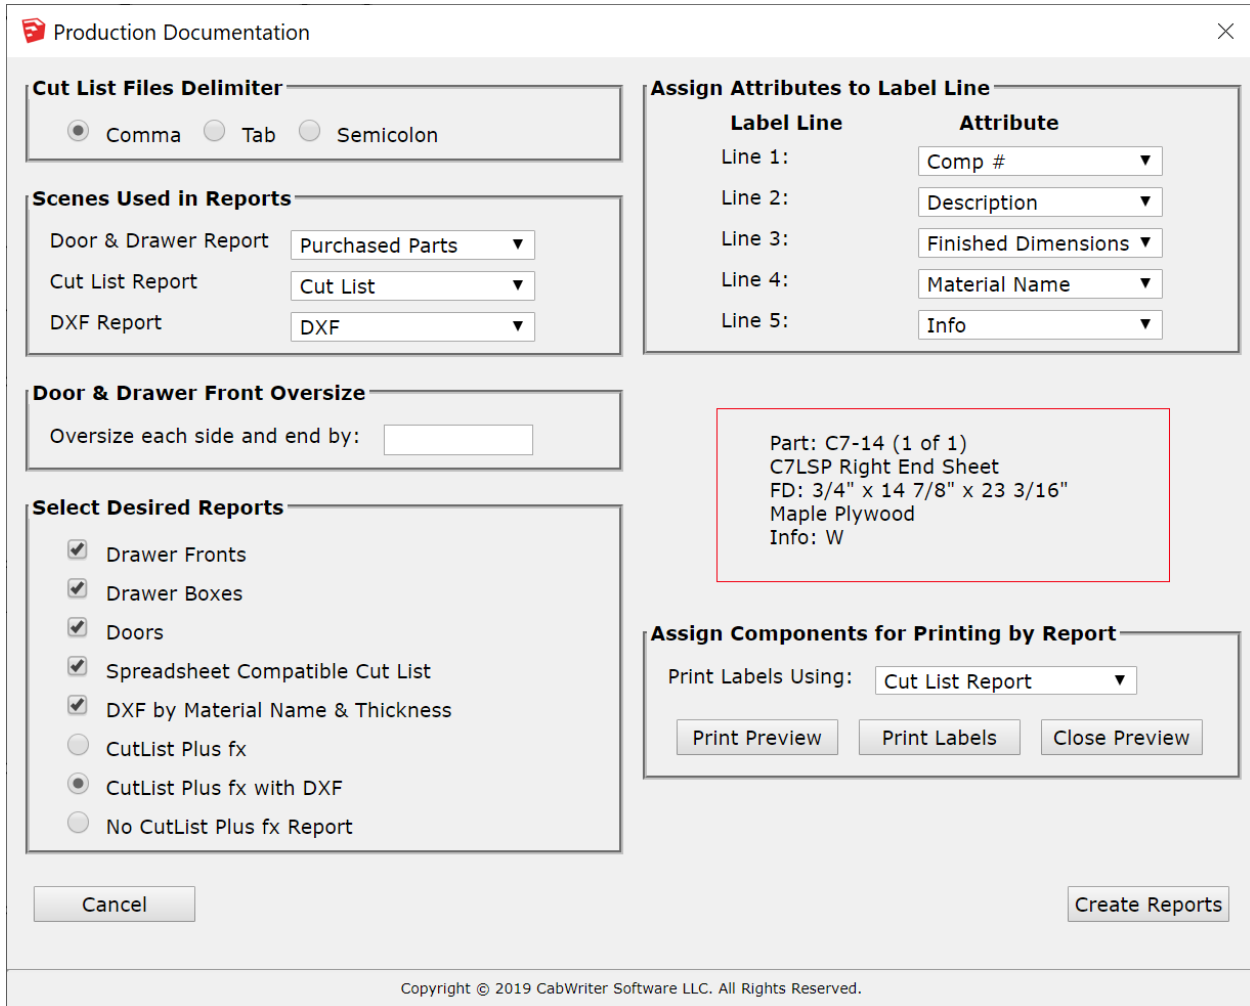

Fixes

1. Changed the name of the Assign Layers dialog box to Assign Layers to Scenes to be more descriptive and accurate. This is the dialog box that appears with menu File > CabWriter > Create Basic Scene Set.
2. Added an error message that will appear when no section cut can be made from the Draw > CabWriter > Create Section From Section Plane menu command.
3. Corrected the Shelf/Fixed Shelf parameter in the CNC Milled Faces section or the CNC Setup tab to a default setting of Top. This is to allow the DXF file generation to mill the tongue including its rabbet.

CabWriter 3.1.0 Release Notes – 7-15-2019

New Functionality

1. Added an additional DXF output organized by sheet thickness & material name as before, but which contains individual part (instance) DXF files, one for each part (instance). The example Production Documentation dialog box is shown below.

The image shows a software dialog box titled "Production Documentation". It contains several sections for configuring report output:

- Cut List Files Delimiter:** Radio buttons for Comma (selected), Tab, and Semicolon.
- Scenes Used in Reports:** Three dropdown menus: "Door & Drawer Report" (Purchased Parts), "Cut List Report" (Cut List), and "DXF Report" (DXF).
- Door & Drawer Front Oversize:** A text field with the label "Oversize each side and end by:".
- Select Desired Reports:** A list of checkboxes: "Drawer Fronts", "Drawer Boxes", "Doors", "Spreadsheet Compatible Cut List", "DXF by Material Name & Thickness" (checked), "CutList Plus fx", "CutList Plus fx with DXF" (selected), and "No CutList Plus fx Report".
- Assign Attributes to Label Line:** A table with 5 rows. Each row has a "Label Line" (Line 1 to Line 5) and an "Attribute" dropdown menu. The attributes are: Comp #, Description, Finished Dimensions, Material Name, and Info.
- Assign Components for Printing by Report:** A dropdown menu for "Print Labels Using:" set to "Cut List Report", and three buttons: "Print Preview", "Print Labels", and "Close Preview".

At the bottom right is a "Create Reports" button. At the bottom left is a "Cancel" button. A red-bordered box highlights a sample report output:

```
Part: C7-14 (1 of 1)
C7LSP Right End Sheet
FD: 3/4" x 14 7/8" x 23 3/16"
Maple Plywood
Info: W
```

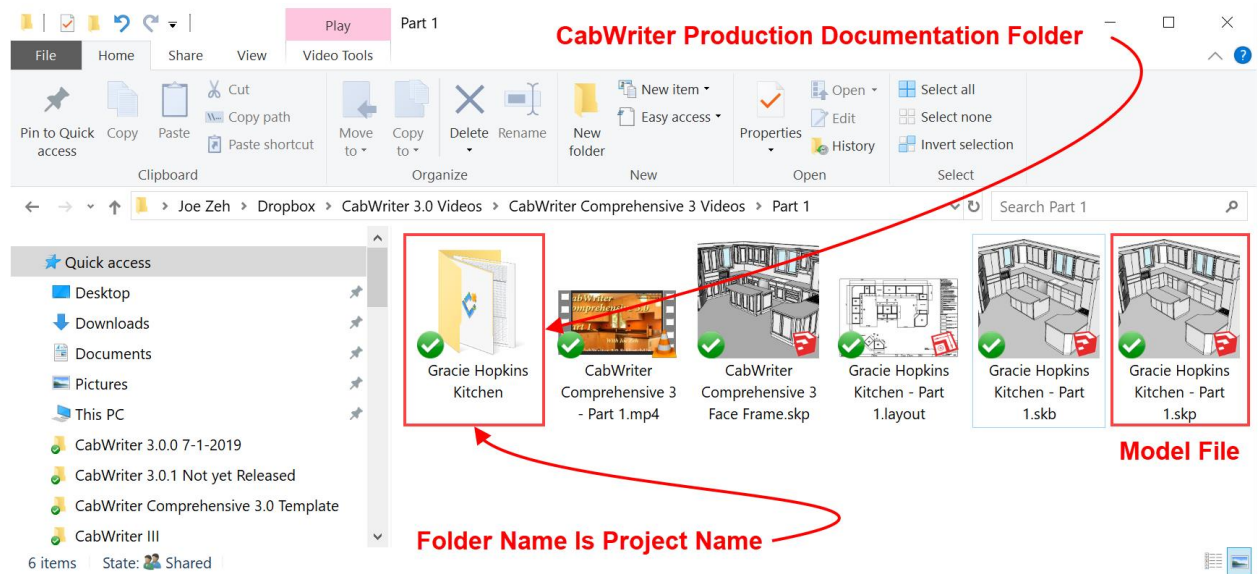

Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

Nothing has changes with any of these reports: Drawer Fronts, Drawer Boxes, Doors, Spreadsheet Compatible Cut List or any of the three CutList Plus fx report selections. The only report affected is DXF by Material Name & Thickness.

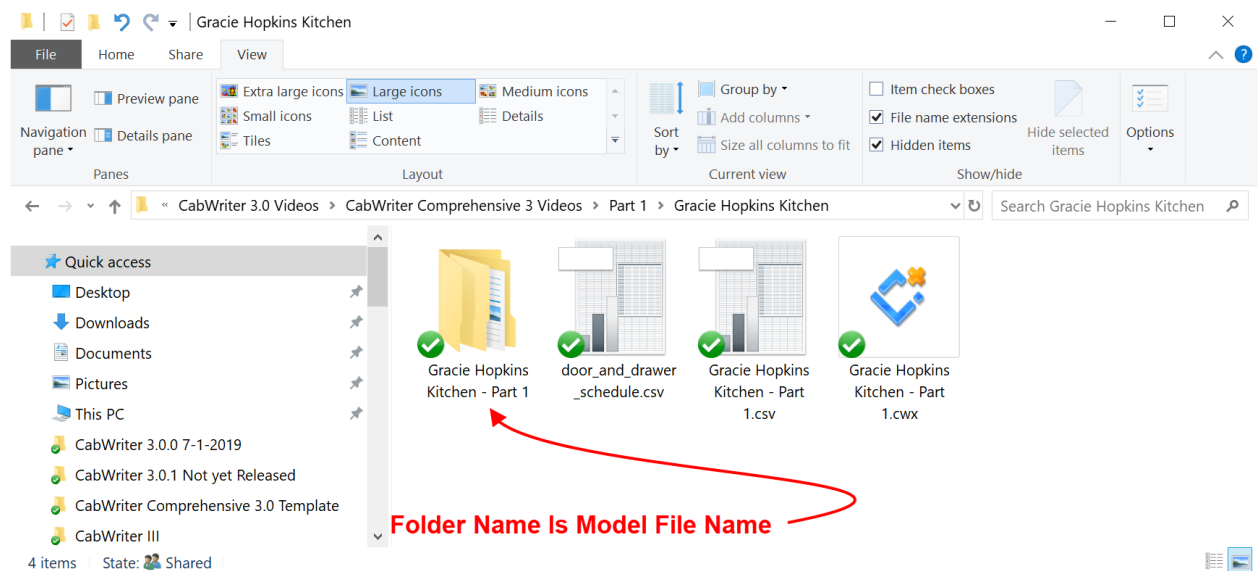

With this change there will be two DXF outputs: the usual DXF Files, now called Integrated DXF Files; and the new Individual DXF Folders.

Let's start by looking at the folder that contains the model file, but after the above CabWriter

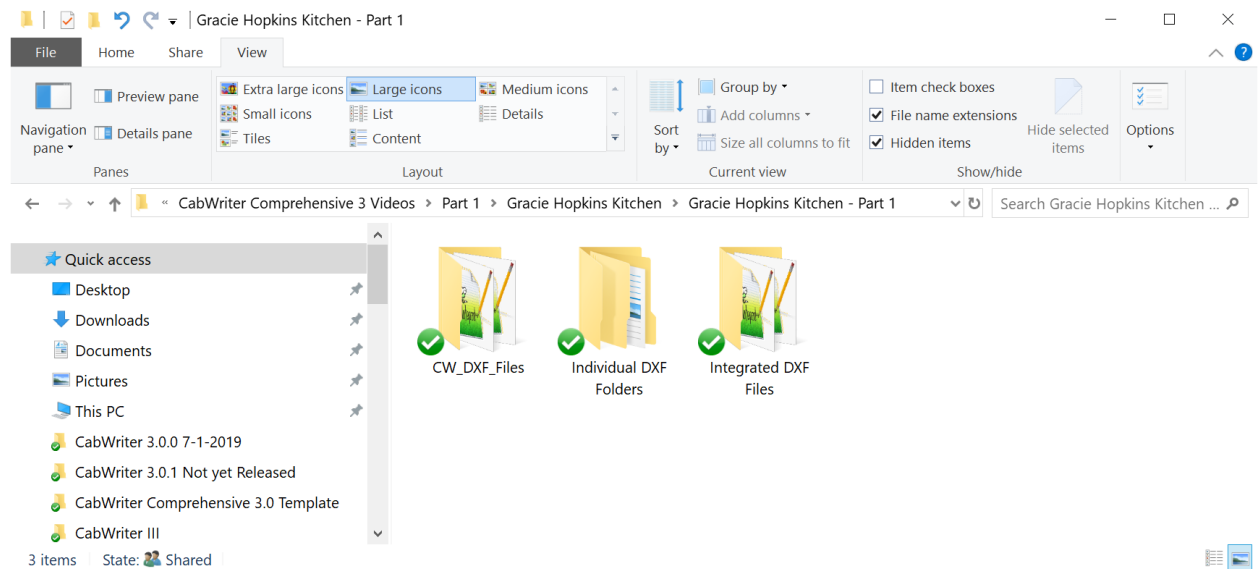

Production Documentation is completed.

Notice the model file at the right has a file name of Gracie Hopkins Kitchen – Part 1 and an extension of .skp. This is the model being used in the upcoming CabWriter Comprehensive 3 multi-part video series. The competition of a File > CabWriter Production Documentation operation places a folder in the same folder as the model file is in, but with a name equivalent to the Project Name. The Project name is the name in the Project Name section of the Project tab. This is generally the same name as the model file name, but in this case they differ by the inclusion or absence of “ – Part 1” . The folder placed in this folder, along with the model file, contains three files and another folder as follows.

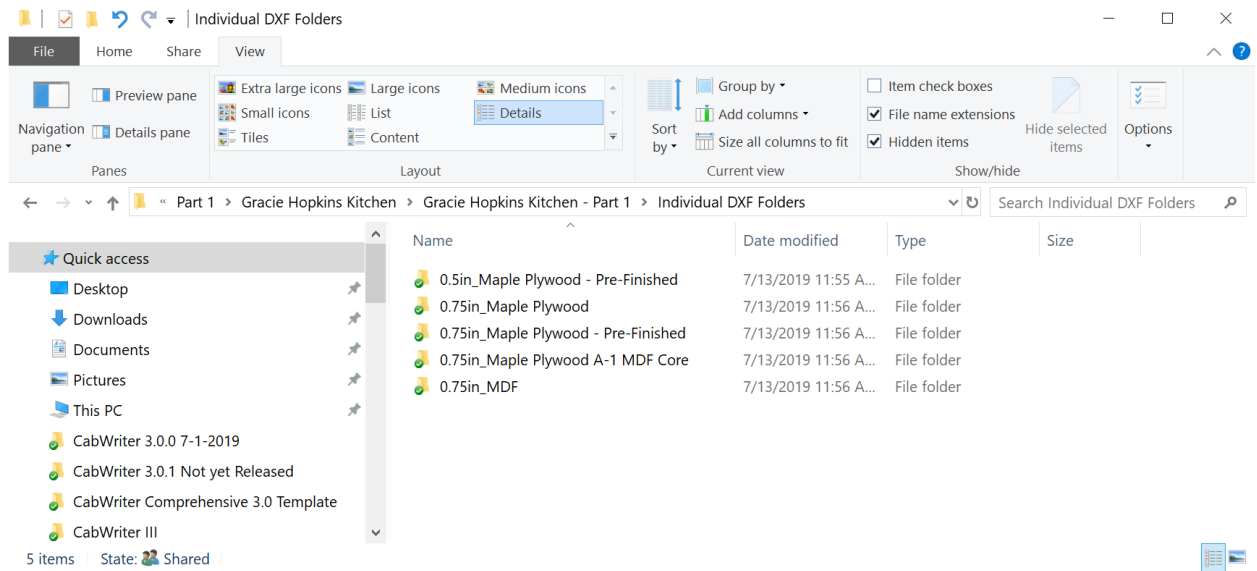

The file with the .cwx extension is the CutList Plus fx version of the cut list. Notice it has the same name as the model file name: NOT the Project Name. There is also a file with a .csv extension with the same name as the model file name. This is the spread sheet version of the cut list. Then there is the door and drawer schedule which is a spread sheet file with the .csv extension. Lastly, there is a folder with the same name as the model file: again NOT the Project Name. Let's look at its contents.

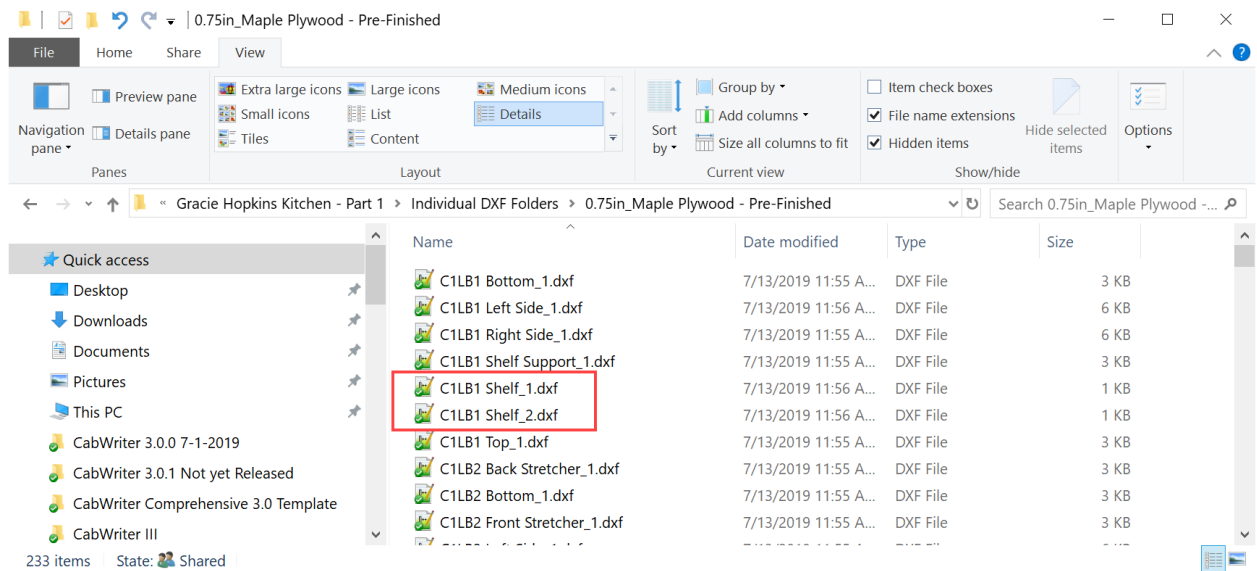

The CW_DXF_Files is the usual output resulting from a CutList Plus fx with DXF selection in the Select Desired Reports section of the Production Documentation dialog box. I won't explain that further because there is no change in this report.

The Integrated DXF Files is the same as the DXF Files that use to be produced by the DXF by Material Name & Thickness report except Integrated has been added to its name to distinguish it from Individual DXF Folders. Both Individual DXF Folders and Integrated DXF Files folders are produced now with this DXF by Material Name & Thickness report. So let's look at the new report.

Notice it contains a number of folders: one for each material thickness and material name.

Within each of these folders is a collection of individual part (instance) DXF files; one for each part (instance) that must be placed on that sheet thickness of that material name. The names of these files is the name of the component the instance belongs to followed by “_i” where I is an integer starting with 1 and going to the number of instances of the component. Let’s look at the contents of 0.75in_Maple Plywood – Pre-Finished.

There are 233 files in this folder, one for each part (instance). Occasionally there are more than one instance of a component such as the C1LB1 Shelf component shown in the red rectangle.

The reason that both Individual DXF Folders and Integrated DXF Files folders are produced is that some models of CNC machines and its software needs to see both.

2.

Fixes

1. Fixed a problem where CabWriter Production Documentation would error if producing a DXF file and one of Prefix 1, Prefix 2 or Prefix 3 entries on the CNC Setup tab DXF Layers section was left blank. Blank is a legitimate default (almost all other defaults in CabWriter require a valid input but not blank), but CabWriter did not correctly account for it. Below is an example of defaults that would result in this error. These same defaults now work with this fix.

Update

Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

2. Fixed a problem where, when creating cut list with either CabWriter Production Documentation or CutList Bridge, if a cut list already existed the new cut list would be appended to it instead of the file being re-written. This would create a cut list with multiple component requirements.
3. Fixed a problem where different cabinets could be assigned the same cabinet number if the user manually assigned a number(s) to cabinets that were larger than the counter kept in CabWriter. This release should be installed before viewing CabWriter Comprehensive 3.
4. Fixed a problem where drawing upper cabinets with Construction Method set to Inset and Back Attachment Method set to Inset Sides & Bottom would result in an incomplete bottom with faces and edges missing.
- 5.

CabWriter 3 Release Notes – 7-1-2019

New Functionality

1. Made a minor change to the File > CabWriter > Create Basic Scene Set tool. Limited the Ladder Plan scene to only walls and toe kick parts (CxxLTK prefix). This keeps other components such as face frame, end panel or back panel components which extend to the floor from being shown in the Ladder Plan scene.
2. Made a parameter name change on the CNC Boring tab to more accurately reflect the function of the parameter. In the Planted Back Construction Holes section changed the parameter Top & Bottom Margin to Edge Margin.
3. Changed two Factory Settings defaults on the Line Boring tab. In the Base Cabinet section Back Row Reference Point was changed from Front to Back and Back Row Offset was changed from 517mm to 37mm. This makes the base and Upper cabinets consistent and also avoids errors raised when holes are drawn in space.

The image shows two side-by-side configuration panels for 'Base Cabinet' and 'Upper Cabinet'. Each panel contains the following settings:

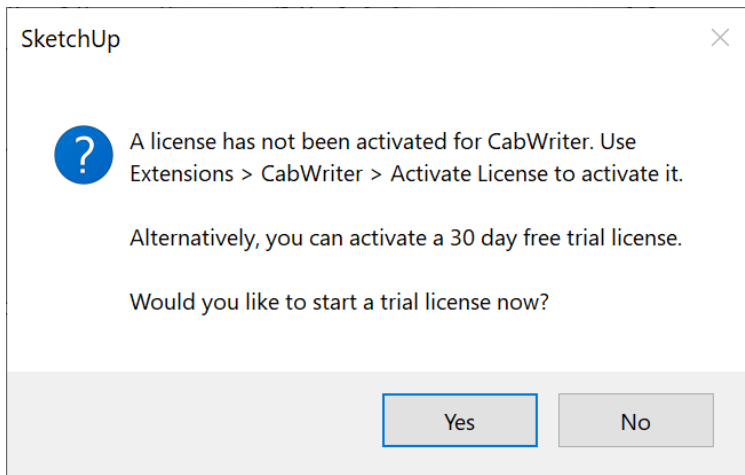

- First Hole Starting Reference: Bottom (dropdown)
- First Hole Distance: 2 1/4" (text field)
- Number of Drill Bits: 23 (text field)
- Back Row Reference Point: Back (dropdown)
- Back Row Offset: 37mm (text field)

4. Added a new menu command. Draw > CabWriter > End Story Stick. This file command was added primarily to assist Mac users who don't have a keyboard End key, and would prefer not to use the Command key because it can accidentally trigger other events. This command works just like pressing the End or Command key in that it signals the end of the story stick and opens the Box Selector dialog box. However, because it is a menu command, users can now assign any keyboard key to it as a hot key.
5. Changed how the Construct Walls tool functions. When the first point is chosen a Provide a Wall Name dialog box opens. In the past the user had to click in the input field with the cursor to begin typing a name. Now the Provide a Wall Name dialog box appears as shown at right. A default sequential number will appear in the input field and that number is highlighted and selected. The user has three choices: immediately begin typing a new name, which will appear in the input field, followed by clicking OK; simply click OK to accept the suggested wall number; or click on Cancel to abort the Construct Walls tool.
6. Added a menu command File > CabWriter to LayOut > Send Selected Scene to LayOut. This menu command allows the user to add a new scene, after all scenes have been sent to LayOut, and send just the new scene to LayOut. Alternatively, after all scenes have been sent to LayOut, the user can

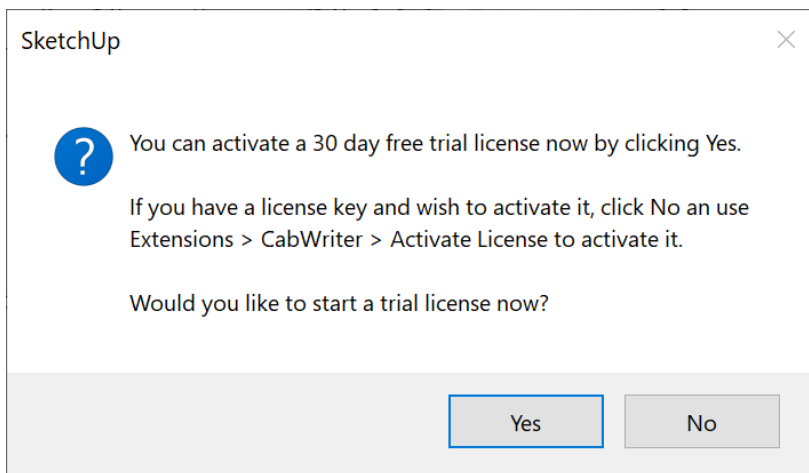

The image shows a dialog box titled 'Provide a Wall Name'. It has a text input field containing the number '1', which is highlighted with a blue selection bar. Below the input field are 'Cancel' and 'OK' buttons. At the bottom of the dialog, there is a copyright notice: 'Copyright © 2019 CabWriter Software LLC. All Rights Reserved.'

edit an existing scene and send it to LayOut. In either case the user has to go back and use the menu command File > CabWriter to LayOut > Hatch Sections in LayOut.

7. Changed the trial license message from:

to:

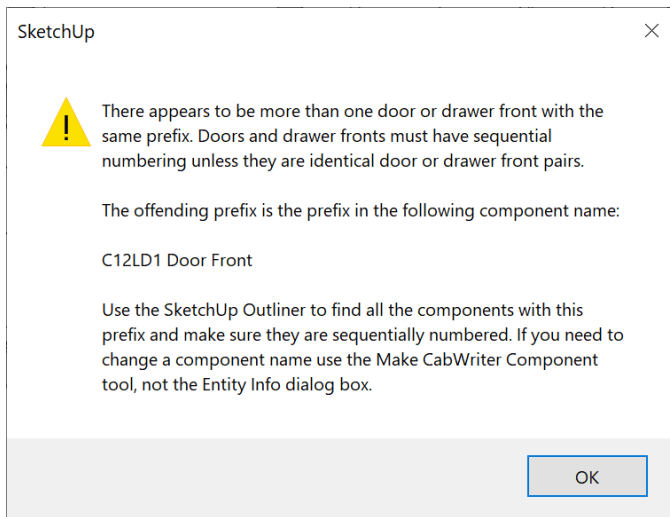

This should remove any ambiguity about how to begin a trial license.

8. Updated all license functionality to accept CabWriter 3.0 licenses and not CabWriter 1.0 or 2.0.
9. Upgraded the CabWriter User's Guide to version 3, though it is still incomplete and a rough draft.
10. Changed the layer that End Sheets are placed on from Base or Upper Boxes to Base or Upper End Panels. End Sheets were originally placed on the Boxes layer with the rationale that they are typically sheet goods and cabinetmakers would likely want to cut them on a CNC machine. But with CabWriter 3.0 it is now easy to include Base or Upper End Panels in the DXF scene, in which case they will be included in the DXF file. However, it is the user's responsibility to include the Base or Upper End Panels layers in the DXF scene.

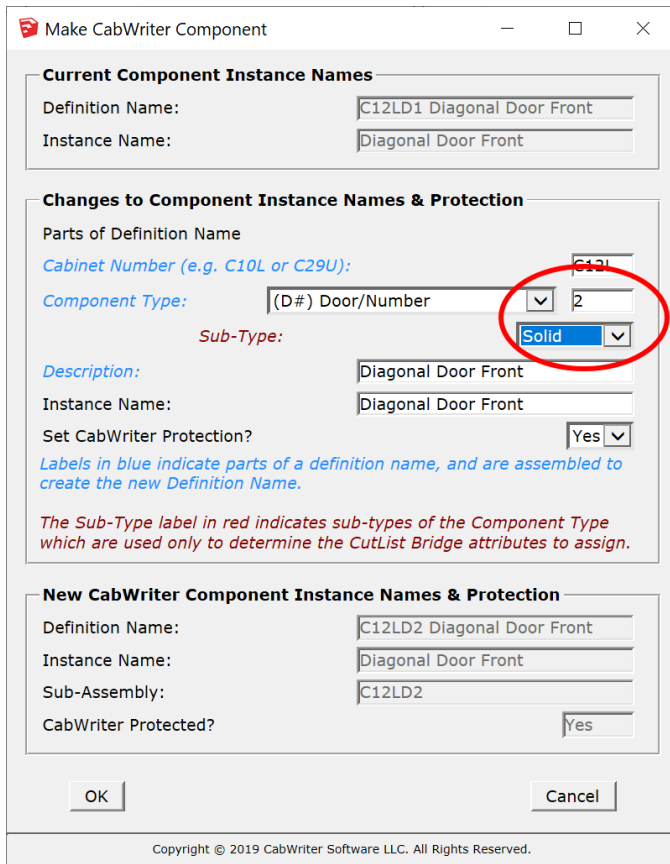

Fixes

1. Fixed problems with drawer front and drawer box placement with new divided cabinets. These problems occurred primarily in frameless designs with no mid-rails.
2. Fixed a problem where seven defaults on the Project tab could not be changed and saved. This problem was introduced by accident in CabWriter 3.0 Alpha 2.
3. Fixed a problem where the hatch images did not appear on the Materials tab.
4. Fixed a problem with the CabWriter Move/Copy Cabinet tool. If the user deleted a cabinet component, such as an end stile that was superfluous, but didn't delete the component from the Component library, and then executed a Move/Copy on that cabinet and error was raised. This situation is now just ignored and no error is raised.
5. Fixed a problem with coped doors. If the door was too narrow to construct and error would be raised. Now, instead of raising an error, it simply draws a slab door.
6. Fixed a problem where selecting the Re-Load Factory Settings tool did not close the CabWriter Setting dialog box if open.
7. Fixed a problem where, if the CabWriter Setting dialog box was open before selecting the Open and Load CabWriter Defaults, the CabWriter Settings dialog box would close but it would not re-open with the loaded defaults file.
8. Fixed a problem with divided upper and divided base cabinets where the adjustable shelf depths were mis-calculated on inset backs with inset distances greater than the back thickness.
9. Fixed a problem on the Materials tab in the Material - Hatch Association section. If a Material Name was specified in a given row and the Hatch Name was None, the None hatch was missing in the last column.
10. Fixed a problem with the refrigerator cabinet with inset joinery. The bottom pocket was mis-positioned too high by an amount equal to the side to floor gap.
11. Fixed a problem with Diagonal Corner Upper cabinets. When the Top/Bottom/Stretcher/Fixed Shelf Joinery section, Construction Method parameter is set to Inset, the tongues on the bottom of the cabinet were placed near the bottom instead of the top.
12. Fixed a problem where doors and drawer fronts could be mis-numbered and mis-named if the number of doors or drawers in a single cabinet exceeded nine.
13. Fixed a problem with divided cabinet where the drawer boxes and drawer slider holes could be misplaced.
14. Fixed the Production Documentation dialog box. When the user had only a Home or Pro license and no CNC license, the label printing side of the dialog box didn't show up.
15. Made cosmetic changes to the Activate CabWriter License dialog box, including leaving some padding on the left of the input field and keeping the labels on one line.
16. Fixed a problem that could arise with used named door and drawer fronts. Doors and drawer fronts in CabWriter must always have unique and sequentially numbered prefixes. If two door or drawer fronts have the same prefix in their component name, but the components are different, an error is raised. As an example, suppose CabWriter named a slab door component C12LD1 Door Front and the user modified or added another door with the component name C12LD1 Diagonal Door Front. This would raise an error when creating Production Documentation even though these are unique component names because their prefixes are not unique. In the past the user would not see the

error unless the Ruby Console was open. Now the error creates a message like this:

In this example, one of the components need to have its prefix changed to C12LD2. Be sure to do this with the Make CabWriter Component tool as follows:

This error is the same as that in 12, and will produce a similar error message.

17. Fixed a bug where pockets were not drawn, or not drawn correctly in frameless cabinets with inset joinery.

CabWriter 3 Beta 3 Release Notes – 4-25-2019

New Functionality

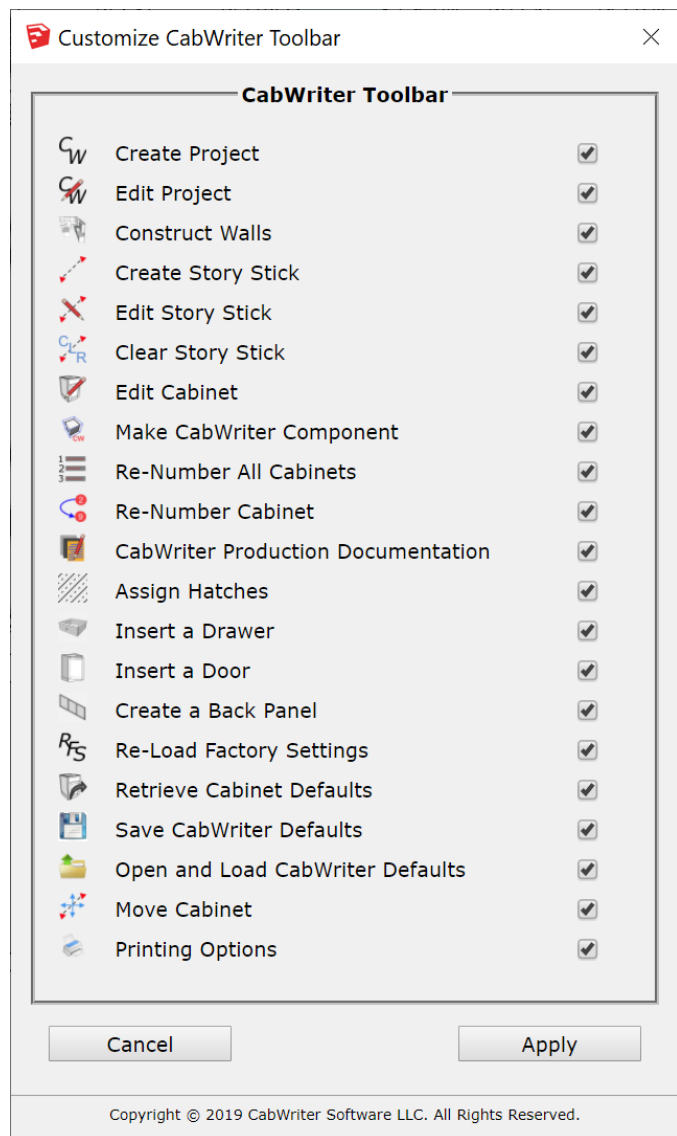

1. Wrapped the construction of a cabinet with a rescue block to let the user know when a cabinet failed to complete, even if the Ruby Console is closed.
2. File > CabWriter > Create Basic Scene Set now creates four basic Perspective scenes using the CabWriter Perspective style. The four scenes are named Perspective 1 through Perspective 4. Each scene includes Base, Upper and Wall layers. The user can rename the scenes as desired, as well as reposition them using the Orbit tool and Updating the scene. Unneeded scenes can be deleted. If a wall is in the way of viewing its layer can be made invisible and the scene updated.
3. The Base Plan view created by File > CabWriter > Create Basic Scene Set no longer includes the Base Ladder layer. The Base Ladder layer is part of the Ladder Plan view.

4. Changed the Story Stick User Mode  tool. When using the Story Stick, the user has the option to press the Alt key on the PC, or the Command key on the Mac, until

the cursor changes to the user mode  cursor. In the user mode the user can specify a non-standard stile width by clicking on the construction line a second time, or, instead of clicking the second time, by just typing in the width of the stick and pressing enter. This has always worked. However, if the user then used one of the re-draw tools, any non-standard stile width was replaced with the standard stile width based on the CabWriter Settings.

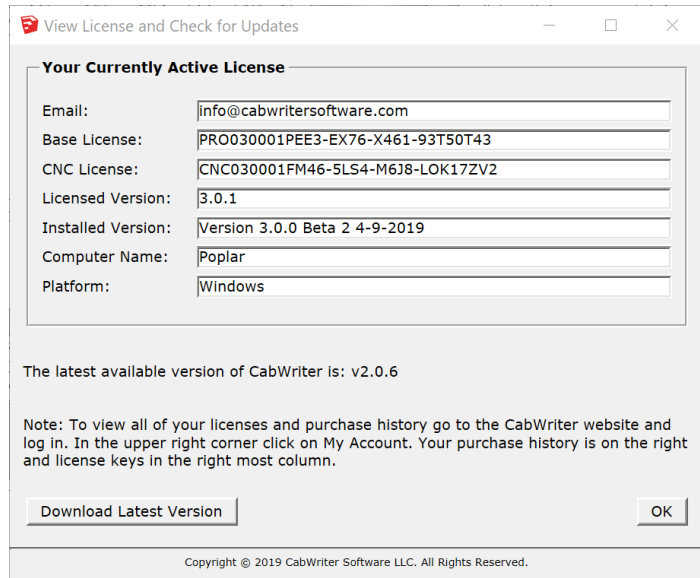

With this change, if the user re-draws a cabinet using the stored defaults, any non-standard width stile will remain the same as first drawn. If the user chooses to re-draw by not using stored defaults, then non-standard width stiles will be replaced with widths specified by CabWriter Settings. This change makes the user mode much more useful.

5. Changed how Extensions > CabWriter > Open User's Guide works. Previously you had to be connected to the internet for the User's Guide to

open because that was its source. With this change you no longer need be connected. The source of the file is Plugins\cabwriter\users_guide.

6. Added a new menu command, Extensions > CabWriter > Customize CabWriter Toolbar, which brings up the dialog box at bottom-right of the previous page. The user can check or uncheck the tool icons which should appear in the CabWriter toolbar. Changes will not take effect until the SketchUp application is next opened.
7. Changed the View License and Check for Updates dialog box. Removed Product ID (it was redundant), changed License Key to Base License and added CNC License. The new dialog box is shown at right.
8. Slab doors have a new parameter on the Cut List tab; in the section called Slab Door & Drawer Undersizing is the parameter Edge Banding Thickness. It has a default of 3mm. Unlike all the other parameters on the Cut List tab, Edge Banding Thickness is an Undersizing parameter, NOT an oversizing parameter. Further, since it is a banding thickness, the applicable door or drawer front will be smaller by twice the dimension in both length and width.

The dialog box is titled "View License and Check for Updates". It contains a section "Your Currently Active License" with the following fields:

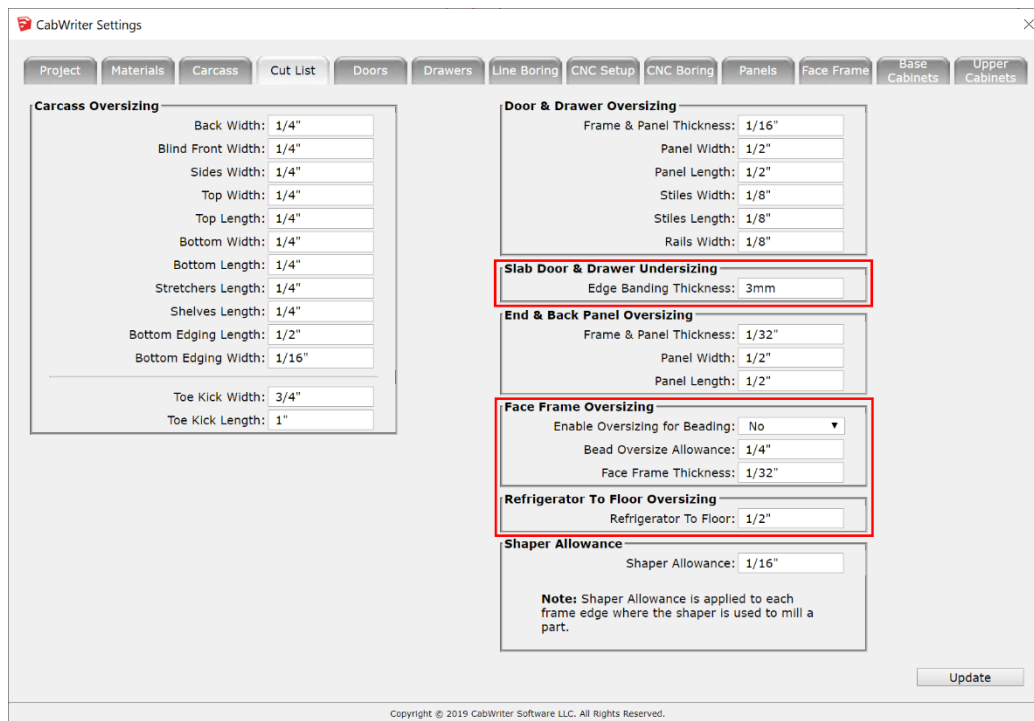

Email:	info@cabwritersoftware.com
Base License:	PRO030001PEE3-EX76-X461-93T50T43
CNC License:	CNC030001FM46-5LS4-M6J8-LOK17ZV2
Licensed Version:	3.0.1
Installed Version:	Version 3.0.0 Beta 2 4-9-2019
Computer Name:	Poplar
Platform:	Windows

Below the license information, it states: "The latest available version of CabWriter is: v2.0.6".

A note follows: "Note: To view all of your licenses and purchase history go to the CabWriter website and log in. In the upper right corner click on My Account. Your purchase history is on the right and license keys in the right most column."

At the bottom, there are two buttons: "Download Latest Version" and "OK".

Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

The dialog box is titled "CabWriter Settings". It has a tabbed interface with the following tabs: Project, Materials, Carcass, Cut List, Doors, Drawers, Line Boring, CNC Setup, CNC Boring, Panels, Face Frame, Base Cabinets, and Upper Cabinets. The "Cut List" tab is currently selected.

The "Carcass Oversizing" section includes the following fields:

Back Width:	1/4"
Blind Front Width:	1/4"
Sides Width:	1/4"
Top Width:	1/4"
Top Length:	1/4"
Bottom Width:	1/4"
Bottom Length:	1/4"
Stretchers Length:	1/4"
Shelves Length:	1/4"
Bottom Edging Length:	1/2"
Bottom Edging Width:	1/16"
Toe Kick Width:	3/4"
Toe Kick Length:	1"

The "Door & Drawer Oversizing" section includes the following fields:

Frame & Panel Thickness:	1/16"
Panel Width:	1/2"
Panel Length:	1/2"
Stiles Width:	1/8"
Stiles Length:	1/8"
Rails Width:	1/8"

The "Slab Door & Drawer Undersizing" section includes the following field:

Edge Banding Thickness:	3mm
-------------------------	-----

The "End & Back Panel Oversizing" section includes the following fields:

Frame & Panel Thickness:	1/32"
Panel Width:	1/2"
Panel Length:	1/2"

The "Face Frame Oversizing" section includes the following fields:

Enable Oversizing for Beading:	No
Bead Oversize Allowance:	1/4"
Face Frame Thickness:	1/32"

The "Refrigerator To Floor Oversizing" section includes the following field:

Refrigerator To Floor:	1/2"
------------------------	------

The "Shaper Allowance" section includes the following field:

Shaper Allowance:	1/16"
-------------------	-------

A note at the bottom states: "Note: Shaper Allowance is applied to each frame edge where the shaper is used to mill a part."

At the bottom right, there is an "Update" button.

Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

9. Changed the Printing Options and Construct Walls toolbar icons to the following respectively.

10. Re-arranged the CabWriter toolbar as follows.

11. Provided separate parameters for End Panel to Face Frame joinery and End Sheet to Face Frame joinery. The defaults are Miter and Butt respectively.

CabWriter Settings

Update

Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

12. CabWriter now provides cut list support for beaded face frames though it does not draw beaded face frames at this time. There are two new parameters on the Cut List tab in the Face Frame Oversizing section: Enable Oversizing for Beading and Bead Oversize Allowance. When the user Enable(s) Oversizing for Beading CabWriter will oversize the length of rails, connector stiles, mid-rails and mid-stiles. The oversizing amount will be either one or two times the Bead Oversize Allowance, depending on whether the component touches another component on each end. See the image above New Feature 8 paragraph.
13. Implemented the Carcass Side to Floor Gap parameter in the Refrigerator Upper section of the Upper Cabinets tab. This parameter works in conjunction with Carcass Sides to Floor? and holds the refrigerator sides off the floor by the amount of the default.

The screenshot shows the 'CabWriter Settings' dialog box with the 'Upper Cabinets' tab selected. The 'Refrigerator Upper' section is highlighted with a red box, showing the following parameters:

- Number of Shelf Hole Columns: 2
- Number of Shelves: 0
- Carcass Gap (Back to Wall): 1/2"
- Carcass Side to Floor Gap: 1/2"** (highlighted with a red box)
- Carcass Sides to Floor?: Yes (dropdown menu)
- End Panels to Floor?: Yes (dropdown menu)

Other sections visible in the dialog include:

- Upper General:** Cabinet Height: 19", Cabinet Depth (Face to Wall): 30 1/2", Carcass Gap (Back to Wall): 1/4", Door/Drawer Front Thickness: 3/4"
- Upper Carcass:** Side Position: Outside (dropdown), Draw Bottom Skin?: No (dropdown), Draw Bottom Trim?: No (dropdown), Draw Alignment Slot?: Yes (dropdown), Top Thickness: 3/4", Side/Partition Thickness: 3/4", Back Thickness: 1/2", Bottom Thickness: 3/4", Bottom Trim Thickness: 1/8", Bottom Skin Thickness: 1/4", Stretcher Width: 3", Alignment Slot Width: 5/32", Diagonal Shelf Board Width: 4 1/2", Opening Filler Width: 6", Alignment Slot Depth: 1/2", Side Setback: 0", Bottom Inset: 1 1/8"
- Standard Upper:** Number of Shelf Hole Columns: 2, Number of Shelves: 2
- Blind Corner Upper:** Number of Shelf Hole Columns: 2, Number of Shelves: 2, Blind Corner Displacement: 13 3/4"
- Diagonal Corner Upper:** Number of Shelf Hole Columns: 2, Number of Shelves: 2, Back Corner: Angled (dropdown), Carcass Gap (Back to Wall): 1/2"
- Divided Upper:** Number of Shelf Hole Columns: 2, Cabinet Height: 36"

An 'Update' button is located at the bottom right of the dialog box.

14.

Fixes

1. Fixed a problem where an abnormally large gap would appear at the top of the door in Divided cabinets with only one door.
2. Fixed another problem with the adjustable shelf in Divided cabinets being misplaced due to incorrect calculation of left_to_right.
3. Fixed a problem with an error message that when occurred the error message itself would not appear due to a coding bug.
4. Fixed a problem where the Entity Info dialog box would not respond after certain types of errors.
5. Fixed a problem that allowed licenses to be activated but not used, instead requiring the user to use a 30-day free trial.
6. When the user issues a Send Scenes to LayOut command, CabWriter opens the new LayOut file so the user can inspect the results. The next logical step is for the user to issue a Hatch Sections in LayOut command. But it is expected that between Send Scenes to LayOut and the subsequent Hatch Scenes in LayOut commands, that the user would close the LayOut file so that it is not open when the Hatch Scenes in LayOut is executing. Previously, if the file were left open an error would be raised, but the user was not informed of the error. There is now a message that instructs the user to close the file and try again.

CabWriter 3 Beta 2 Release Notes – April 9, 2019

New Functionality

1. Made a change to the Scenes Used in Reports section of the Production Documents dialog box. Previously, the contents of the three drop down fields were saved in the PrivatePreferences.json file (SketchUp's version of the PC Registry or the Mac Plist files). This meant that they were saved with the application, not the model. Since the contents of these fields can be different with each user model (scene names are often different in each model) it made more sense to save them in the model (in Layer0).
2. Added the ability to print Avery 5160 style labels with selected component information. The new Production Documentation dialog box looks as follows:

The screenshot shows the 'Production Documentation' dialog box. It has a title bar with a red icon and a close button. The dialog is divided into several sections:

- Cut List Files Delimiter:** Radio buttons for Comma (selected), Tab, and Semicolon.
- Scenes Used in Reports:** Three dropdown menus for 'Door & Drawer Report' (Purchased Parts), 'Cut List Report' (Cut List), and 'DXF Report' (DXF). A red arrow labeled '3' points to the 'DXF Report' dropdown.
- Door & Drawer Front Oversize:** A text field labeled 'Oversize each side and end by:'.
- Select Desired Reports:** A list of checkboxes and radio buttons. A red arrow labeled '2' points to the 'Drawer Fronts' checkbox. The options are:
 - ☒ Drawer Fronts
 - ☒ Drawer Boxes
 - ☒ Doors
 - ☒ Spreadsheet Compatible Cut List
 - ☒ DXF by Material Name & Thickness
 - ☐ CutList Plus fx
 - ☐ CutList Plus fx with DXF
 - ☐ No CutList Plus fx Report
- Assign Attributes to Label Line:** A table with two columns: 'Label Line' and 'Attribute'.

Label Line	Attribute
Line 1:	Comp #
Line 2:	Description
Line 3:	Finished Dimensions
Line 4:	Material Name
Line 5:	Info
- Assign Components for Printing by Report:** A dropdown menu labeled 'Print Labels Using:' with 'DXF Report' selected. A red arrow labeled '1' points to this dropdown. Below it are buttons for 'Print Preview', 'Print Labels', and 'Close Preview'.
- Red Box:** A red-bordered box containing the following text:

Part: C4-4 (1 of 1)
C4UB1 Left Side
FD: 3/4" x 11 7/16" x 34 7/8"
Maple Plywood - Pre-Finished
Info: W
- Buttons:** 'Cancel' and 'Create Reports'.
- Footer:** Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

The field selection on the left side of this dialog box are saved with the model (Layer0) when the Create Reports button is pressed. The field selections on the right are save with the model (Layer0) when any of the three buttons in the Assign Components for Printing by Report section are pressed.

Notice the red box. This box will only appear when all conditions are met for choosing a Scene, from

which to get a collection of components that will be printed on the Avery labels. The Scene that will be the source of these components must appear in one of the three fields in the Scenes Used in Reports section. In addition, the Print Labels Using: field in the Assign Components for Printing by Report section must point to the field in the Scenes Used in Reports section that contains the source Scene.

In the example on the previous page, Print Labels Using: field is pointing to the DXF Report. The DXF Report field is pointing to the model's DXF Scene. This means that every CabWriter component that is included in the DXF Scene, except drawer boxes, will be included in printing labels.

The contents of the labels is selected by the Line 1: through Line 5: fields. As you select the information to be included the red box will be updated and show a sample label. In fact, the red box will be updated whenever the drop downs in the Scenes Used in Reports section are changed; when Line 1: through Line 5: drop downs are changes; or when the Print Labels Using: drop down is changed. Providing, of course, that the conditions for showing the red box are met.

You can preview the first sheet of printout with the Print Preview button, in fact, you must press this button to bring up the preview page, and you must leave that page open to use the Print Labels button to actually print your pages of labels. You can close the preview page with the Close Preview button.

It is highly recommended that you print one page of labels on plain paper first to see if the alignment is correct for the Avery 5160 labels. Unfortunately, this may not work on some printers that have built-in margins that the user cannot change.

3. CabWriter now adds the construction holes in backs drawn with CNC Drilling Method. Below is shown the CNC Boring tab with their parameters and default settings.

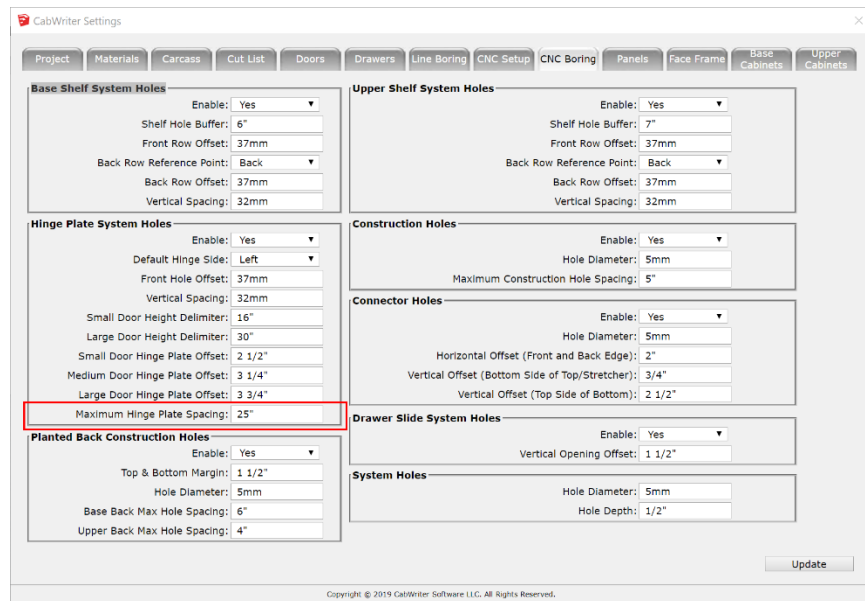

The screenshot shows the 'CabWriter Settings' dialog box with the 'CNC Boring' tab selected. The 'Planted Back Construction Holes' section is highlighted with a red box. The settings are as follows:

Section	Parameter	Value
Base Shelf System Holes	Enable	Yes
	Shelf Hole Buffer	6"
	Front Row Offset	37mm
	Back Row Reference Point	Back
	Back Row Offset	37mm
Hinge Plate System Holes	Enable	Yes
	Default Hinge Side	Left
	Front Hole Offset	37mm
	Vertical Spacing	32mm
	Small Door Height Delimiter	16"
Upper Shelf System Holes	Enable	Yes
	Shelf Hole Buffer	7"
	Front Row Offset	37mm
	Back Row Reference Point	Back
	Back Row Offset	37mm
Construction Holes	Enable	Yes
	Hole Diameter	5mm
Connector Holes	Enable	Yes
	Hole Diameter	5mm
	Horizontal Offset (Front and Back Edge)	2"
	Vertical Offset (Bottom Side of Top/Stretcher)	3/4"
	Vertical Offset (Top Side of Bottom)	2 1/2"
Drawer Slide System Holes	Enable	Yes
	Vertical Opening Offset	1 1/2"
System Holes	Hole Diameter	5mm
	Hole Depth	1/2"
Planted Back Construction Holes (highlighted)	Enable	Yes
	Top & Bottom Margin	1 1/2"
	Hole Diameter	5mm
	Base Back Max Hole Spacing	6"

Copyright © 2019 CabWriter Software LLC. All Rights Reserved.

4. CabWriter will now add additional hinge plate holes in tall door situations providing;
 - a. The project is a CNC project as indicated by the Drilling Method parameter in the General section of the Project tab.
 - b. Shelf System Holes are disabled for the appropriate Base or Upper as indicated by the Enable parameter on the CNC Boring tab.
 - c. The top and bottom hinge spacing is greater than the parameter Maximum Hinge Plate Spacing in the Hinge Plate System Holes section of the CNC Boring tab.

The number of incremental hinges is controlled by the spacing between the top and bottom hinge and the Maximum Hinge Plate Spacing parameter. If the Enable parameter is Yes in the Base or Upper Shelf System Holes section of the CNC Boring tab, no additional hinges will be added. In this case it is assumed the user will use shelf holes to secure additional hinges. Notice the new Maximum Hinge Plate Spacing parameter in the CNC Boring tab below.

5. CabWriter now provides another way to control what parts (component instances) end up in cut lists and DXF files. Previously the parts that are in the cut lists and DXF files were determined by the layers that were visible within a scene. That is still true; but now you can further control which parts in a scene are included or left out.

Before explaining the procedure let me explain some changes. When SketchUp is opened and CabWriter is loaded, three style files are added to the models Styles library (dialog box). They are: CabWriter Perspective; CabWriter Non-Section; and CabWriter Section. It is highly recommended that when creating scenes in a CabWriter project that you use one of these three styles for your scene. CabWriter Perspective should be used for all of the perspective scenes you create. When CabWriter creates scenes, either with Create Basic Scene Set or Create Section From Section Plane, it will use the appropriate style. As their name implies, CabWriter Non-Section style is used on

scenes such as cut lists, DXF, and elevation scenes, which don't require a section plane. Plan views or elevation section views will use the CabWriter Section style. One of the parameters remembered by these styles is Hidden Geometry. Which brings me to the new feature, the ability to hide one or more parts in a scene and keep them from appearing in either the cut lists or the DXF files.

As an example, suppose you want to cut all cabinet carcass parts on a CNC machine except cabinet C5U's carcass parts. Here is the procedure:

- a. Select the scene that will be used to create the DXF files. Make sure the scene's tab is active.
- b. Select the part or parts you wish to hide. DO NOT use CabWriter's context menu selection tools. Doing so may select parts you don't want selected. For example, when you select a cabinet using context menu CabWriter > Select Cabinet, the entire cabinet is selected and all you want to select is the carcass parts. So use the SketchUp native Select tool.
- c. In the Entity Info dialog box on the bottom left click the eye icon to hide the selected parts.
- d. Lastly, right click on the active scenes tab and choose Update.

At a later date you might decide to include C5U's carcass parts in the DXF files. Here is the procedure for un-hiding the hidden parts.

- a. Select the scene that will be used to create the DXF files. Make sure the scene's tab is active.
- b. Go to the View menu and check Hidden Geometry. The hidden part will appear in a checkered blue outline.
- c. Select the blue outlines part(s) using the native Select tool.
- d. In the Entity Info dialog box on the bottom left click the eye icon to un-hide the selected parts.
- e. Go to the View menu and un-check Hidden Geometry.
- f. Lastly, right click on the active scenes tab and choose Update.

This technique can be used to create plan or section view of just one cabinet. Simply choose all cabinet parts except the cabinet you want included in the scene.

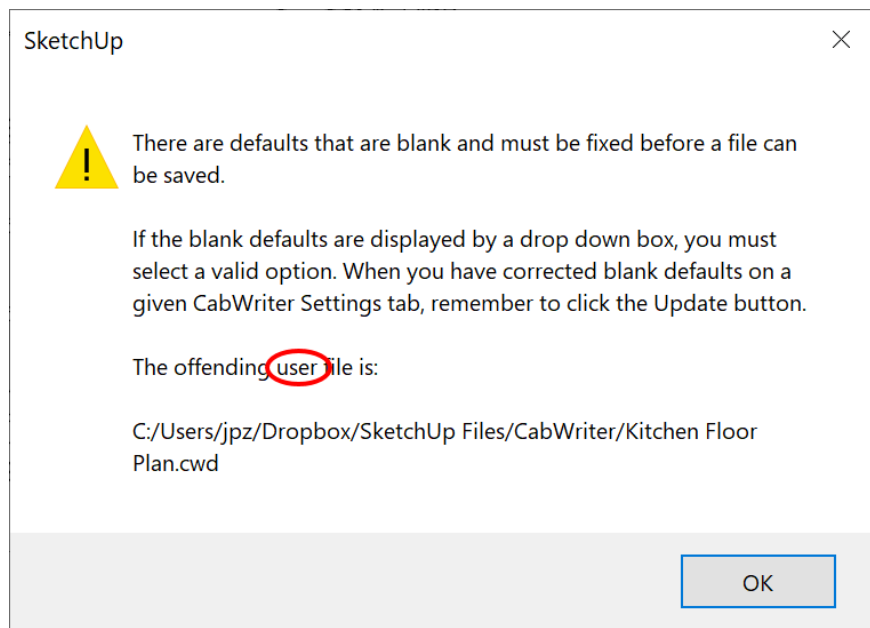

6. In CabWriter 3.0 Beta 1 we added a new tool called Move Cabinet  and Move/Copy Cabinet. In Beta 2 we added a companion tool, accessed only through the context menu, called Mirror Cabinet; Context menu CabWriter > Mirror Cabinet. To use it select one, and only one, part on any cabinet and then go to the Context menu CabWriter > Mirror Cabinet. Mirror Cabinet has no tool icon in the toolbar. This tool will prove useful in kitchens where you might want symmetry around a window, or in a bathroom vanity situation or even in an entertainment for symmetry around a large TV screen. In the example on the next page I first used the Move/Copy Cabinet tool to move a cabinet and then mirrored it with the Mirror Cabinet tool.

Note: The Mirror Cabinet tool is a re-draw tool. Plan ahead and if you are going to use this tool; do not customize any cabinet parts until you have done the Move/Copy and Mirror Cabinet operations.

7. In CabWriter 3.0 Beta 1 we added functionality to the Divided Upper and Divided Base cabinets that allowed 15 divisions and the automatic drawing of doors and drawers. However, not adjustable shelves were drawn. Our thinking at the time is that we had no idea how many shelves a user would want in any compartment, especially since the size of the compartment could be very large or very small. In Beta 2 we decided to add one adjustable shelf behind each door in the Divided Upper or Divided Base. Then, if the user wants more they can simply use native SketchUp tools to Move/Copy as many as needed. Instance names can be changed in the Entity Info dialog box. No need for creating a custom part and using the Make CabWriter Component tool. If no shelves are desired, it is a simple matter of deleting the shelf. If shelves are added or moved, consider using the Set CabWriter Protection tool.
8. With each new release of CabWriter there exists the possibility on new parameters added, or old parameters deleted. In the past we suggested using the Re-Load Factory Settings tool when opening an old model from a previous CabWriter revision before opening a user defaults file. With more and more people using CabWriter, and each creating a library file of user defaults, we decided to add a new tool; menu Extensions > CabWriter > Update Defaults Files. This tool will examine all defaults files: Imperial, Metric and User. If it finds old parameters that have been deleted it will remove them from the file. If it finds missing parameters due to new parameters being added it will add them to the file. If it finds valid parameters that are blank it will report the file in question and the user must manually examine and fix that file. This tool should be used at least once on every new installation of CabWriter, **UNLESS** the user does not want their user defaults modified. In any case, since this is a Beta release, it is recommended that the user manually backs up their user defaults folder.

As mentioned earlier, if a parameter is blank a message will appear like that at right. Notice the red ellipse indicates it is a user file and gives the offending file location and name. After the Update Defaults Files tool completes, the user can manually fix this by loading that file, examining each CabWriter Settings tab for the blank parameter(s), adding the desired default and then saving the defaults to the offending file. You may have to do this for more than one file. After completing the fixes it is suggested you run Update Defaults Files again until you get a clean pass.

Update Defaults Files can take on the order of 30 seconds or more to complete. Be sure to wait for the message indicating completion.

Fixes

1. Fixed an issue where the Template drop down in the LayOut Document SetUp dialog box pointed to LayOut 2018 Templates regardless of SketchUp version the user was using.
2. Fixed a problem where combo drawers would always be drawn as a solid, regardless of drawer height.
3. Fixed a problem where combo draws drawn in frame and panel would be left as a group instead of individual frame and panel components.
4. Fixed a problem with Create Basic Scene Set. When using this tool, without assigning hatches to materials, the section color should default to SketchUp's Front color. It was defaulting to the Back (inside) color.
5. Fixed an issue with CabWriter Production Documentation. If a model's file name is the same as the folder's name it resides in, and the Project name are all the same, an error would be raised with the message "The requested file is locked or in use by another application".
6. Fixed an issue with CabWriter running on SketchUp 2019. It appears that Trimble SketchUp made a change to the Ruby interpreter that causes a certain code configuration to evaluate incorrectly. I placed a bug report with SketchUp and coded a work around. This problem appears when drawing a Standard Base cabinet. The hinge and shelf hole configuration is as though the cabinet is a Standard Base w/Drawer(s).

Update: SketchUp was able to reproduce the problem and is working on a fix.

7. Fixed the CabWriter angle_between(uv1, uv2) method, which was not robust enough for the Mirror Cabinet tool; it always assumed one vector was on the positive Red or Green axis.
8. Fixed two Undo operations which included parts of other operations.
9. Fixed a problem where the Create Section From Section Plane tool did not set the correct style; CabWriter Section style.
10. Fixed a problem where the Drawer Box report wasn't looking at the specific component's defaults to determine the drawer slide requirements. Rather it was looking at the current contents of the CabWriter Settings.
11. Fixed a problem that crept in somewhere along the way that didn't permit successful conclusion of Hatch Sections in LayOut.
12. Improved a number of error messages having to do with file operations, so the user could more directly and easily figure out what went wrong.

CabWriter 3 Beta 1 Release Notes – 3-12-2019

Very Important:

1. It is recommended that you DO NOT install and use CabWriter 3.0 Beta 1 on projects created in CabWriter 2.x.x. Divided Upper and Divided Base cabinets have changed significantly in CabWriter 3.0 and they are not compatible with CabWriter 2.0. Use CabWriter 3.0 only on new projects.
2. The CabWriter 2 with CutList Bridge DXF User's Guide has not been updated for 3.0. However, with this release we are providing a video called CabWriter 3.0 Beta 1, which demonstrates the changes in 3.0 Beta 1. Be sure to view it on our website.
3. Divided Base and Divided Upper cabinets no longer require the aid of Insert a Door and Insert a Drawer tools. These boxes/cabinets now draw the doors and drawers on their own. However, because we have had no user beta testing on the new Divided Base and Divided Upper cabinets to date, we have left these tools in to assist if there is a problem which requires their use. Once we establish that user's are comfortable with the new boxes we will remove these tools.
4. When using the Divided Upper and Divided Base boxes/cabinets, be sure to very carefully inspect them to be sure you are getting what you expect. Look very carefully at drawer box positioning (margins left, right, top and bottom) and height. The number of combinations of boxes that are possible is extremely large and hence makes it impossible for us to test them all.
5. Report all errors to me at jpz@srww.com and please send along your zipped SketchUp file.

New Functionality

1. Moved the Associate Material to Hatch dialog box to CabWriter Settings on a new tab called Materials. Along with this change the Materials section of the Project tab has been removed and placed on the Materials tab. The new Materials tab looks like the image below.

CabWriter Settings

Project Materials Carcass Cut List Doors Drawers Line Boring CNC Setup CNC Boring Panels Face Frame Base Cabinets Upper Cabinets

Material - Hatch Association

	Material Type	Material Name	Hatch Name	Rotation	Scale
●	Rough Lumber:	Maple	Adobe Rammed Earth	0°	1x
●	Dimensioned Lumber:		None	0°	1x
●	Sheet Good:	Shop Plywood	Black Dots 1	0°	1x
●	Wall:	Wall	Brick Common Face	0°	1x

Materials

Type	Name	
Frame:	Rough Lumber	Maple
Door/Drawer Panel:	Sheet Good	Maple Plywood
End Panel:	Sheet Good	Maple Plywood
Back Panel:	Sheet Good	Maple Plywood
Carcass:	Sheet Good	Maple Plywood - Pre-F
Trim & Banding:	Rough Lumber	Maple
Slab Door/Drawer Front:	Sheet Good	Maple Plywood
Toe Kick Applied Front:	Rough Lumber	Maple

Update

Copyright © 2018 CabWriter Software LLC. All Rights Reserved.

Notice there are seven columns and five rows in the Material – Hatch Association section.

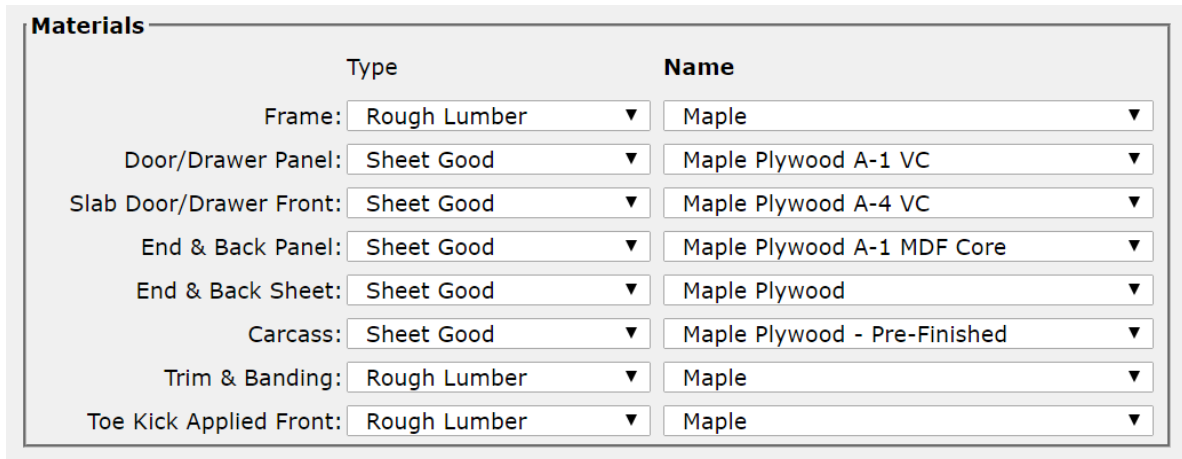

Row_1:Column_1 and Row_1:Column_7 are not labeled, but the in-between columns in Row_1 have the labels of Material Type, Material Name, Hatch Name, Rotation and Scale. Column_1 contains four lights. These will be green only when all Material Names in Column_3 have been assigned a Hatch Name in Column_4 for each row; or when a row in Column_3 is blank, such as Dimensioned Lumber in the above image, indicating there are no Dimensioned Lumber materials used that need a hatch assignment.

Each of the four rows labeled Rough Lumber, Dimensioned Lumber, Sheet Good and Wall may have more than one Material Name. To assign all Material Names the user must check the drop down boxes in the Material Name column.

A Red light in Column_1 indicates that at least one of the Material Names in that row is missing a hatch association. It may not be visible until the user selects that Material Name from the drop down box. When a new CabWriter project has been created, and before any cabinets have been

drawn, all four lights will be Red indicating that there are no components, hence no Material Names to associate a Hatch Name.

2. Re-named and re-defined two defaults in the Materials section of the Materials tab of CabWriter Settings. See the image below.

Type	Name
Frame:	Rough Lumber ▼ Maple ▼
Door/Drawer Panel:	Sheet Good ▼ Maple Plywood A-1 VC ▼
Slab Door/Drawer Front:	Sheet Good ▼ Maple Plywood A-4 VC ▼
End & Back Panel:	Sheet Good ▼ Maple Plywood A-1 MDF Core ▼
End & Back Sheet:	Sheet Good ▼ Maple Plywood ▼
Carcass:	Sheet Good ▼ Maple Plywood - Pre-Finished ▼
Trim & Banding:	Rough Lumber ▼ Maple ▼
Toe Kick Applied Front:	Rough Lumber ▼ Maple ▼

The End Panel default has been re-named to End & Back Panel and Back Panel default has been renamed to End & Back Sheet. Also notice the Slab Door/Drawer Front default has been moved up to the third default from the top. Here are the new definitions for End & Back Panel and End & Back Sheet.

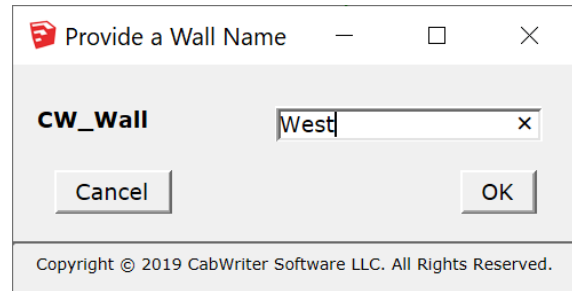

End & Back Panel – This default applies to the panel material in a frame and panel End Panel or Back Panel.

End & Back Sheet – This default applies to the sheet material in an End Sheet or Back Sheet.

Note: Doors and Drawer Fronts have their own panel default (Door/Drawer Panel) and sheet default (Slab Door/Drawer Front).

3. The user now provides the wall name. Upon the first click of the Construct Walls tool a dialog box appears as shown below. The user must supply a unique and short wall name. If it is not unique SketchUp will append a number to the end to make it unique. The wall name provided by the user will be prefixed with "CW_Wall ". In the example the wall below will be named CW_Wall West. CW_Wall West will be placed on layer Wall, West by prefixing the name with "Wall, ".

Modified the behavior of the Construct Walls tool. The Left Arrow key will now lock the wall to the Green axis; the Right Arrow Key will lock the wall to the Red axis.

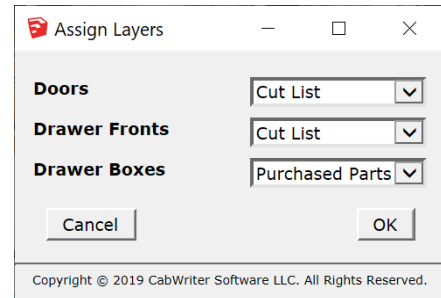

As you move the Construct Walls cursor, if any of the four corner points are in a negative quadrant the rectangle outline will turn purple and stippled with long dashes. This indicates an illegal placement of the wall. You might be able to fix this with the Ctrl key by flipping the wall to the opposite side of the starting point. Otherwise you have to begin the wall in another location in the model. So plan ahead before drawing walls to be sure your entire model will be in the positive quadrant. See example below.

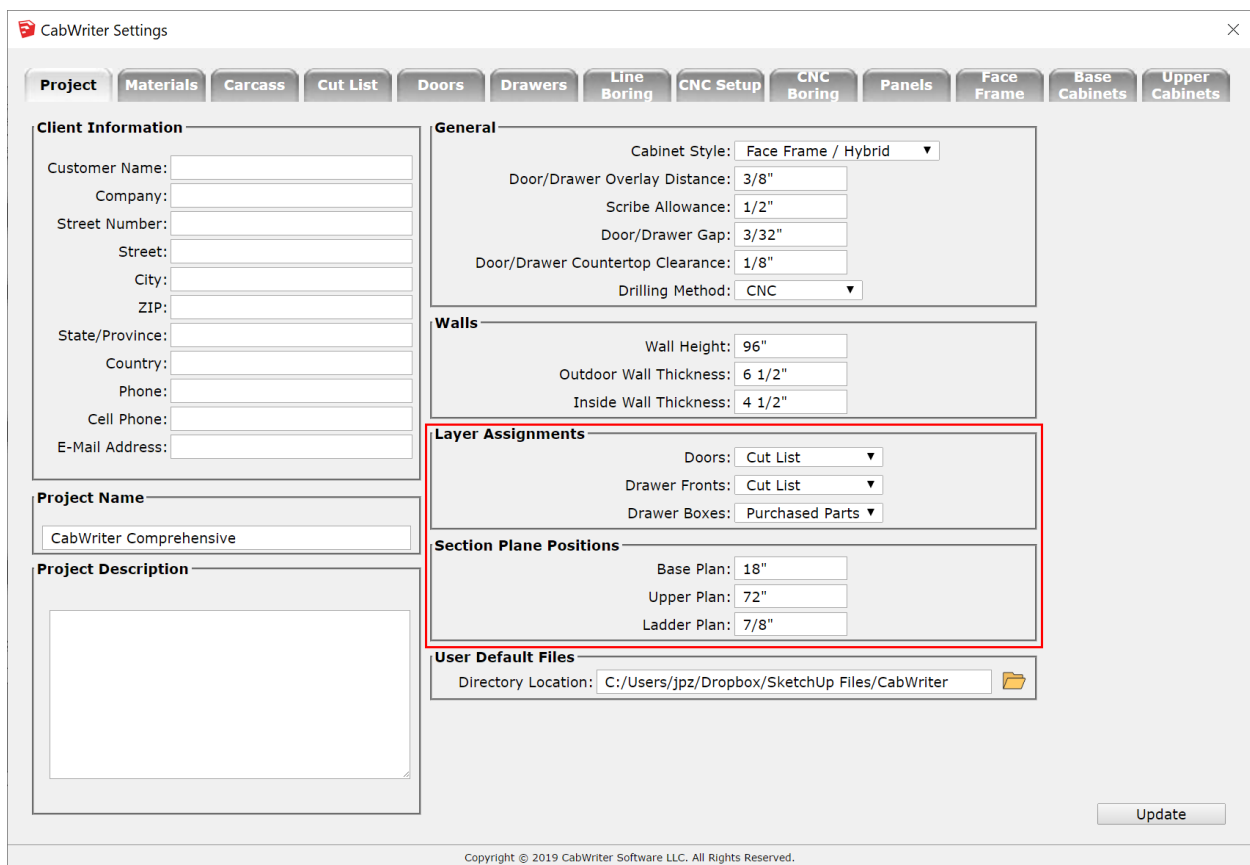

4. CabWriter now automatically generates the Cut List, DXF, Purchased Parts, Base Plan, Upper Plan and Ladder Plan scenes. Choose menu File > CabWriter > Create Basic Scene Set and the following dialog box appears.

The user can choose which scene the Doors, Drawer Fronts and Drawer Boxes appear in. The default selections, shown in this dialog box image, are assigned using the defaults that appear in the Layer Assignments section of the Project tab in CabWriter Settings. The user can change these defaults and/or change the assignments in this dialog box. After pressing OK the automatic generation begins.

The 'Assign Layers' dialog box is a small window with a title bar containing a red icon, the text 'Assign Layers', and standard window controls. It contains three rows of settings: 'Doors' with a dropdown menu set to 'Cut List', 'Drawer Fronts' with a dropdown menu set to 'Cut List', and 'Drawer Boxes' with a dropdown menu set to 'Purchased Parts'. Below these are 'Cancel' and 'OK' buttons. At the bottom, a copyright notice reads: 'Copyright © 2019 CabWriter Software LLC. All Rights Reserved.'

The vertical positioning of the Section Planes for the Base, Upper and Ladder Plan scenes is set by defaults in the Section Plane Positions section of the Project tab in CabWriter Settings. The Base and Upper Plan Plane Positions are set to section the base and upper cabinets half way up their height for standard cabinets. The Ladder Plan Plane Position is set at 7/8" to capture the horizontal stretchers; much higher and they will be left out of the section cut. The user can change these defaults to alter a scene or select the appropriate section plane used in a scene and manually move it up or down. See the Project tab below.

The 'CabWriter Settings' window is a large application window with a title bar and a tabbed interface. The tabs include 'Project', 'Materials', 'Carcass', 'Cut List', 'Doors', 'Drawers', 'Line Boring', 'CNC Setup', 'CNC Boring', 'Panels', 'Face Frame', 'Base Cabinets', and 'Upper Cabinets'. The 'Project' tab is selected. It contains several sections: 'Client Information' with fields for name, company, address, and contact; 'Project Name' with a text field; 'Project Description' with a large text area; 'General' with settings for cabinet style, overlay distance, scribe allowance, gap, clearance, and drilling method; 'Walls' with wall height and thickness settings; 'Layer Assignments' (highlighted with a red box) with dropdowns for doors, drawer fronts, and drawer boxes; 'Section Plane Positions' (also highlighted with a red box) with input fields for base, upper, and ladder plan heights; and 'User Default Files' with a directory location field. An 'Update' button is at the bottom right. A copyright notice is at the very bottom.

- Added an option to the Box Selector and Modify Box Selector dialog boxes “Override Default Hinge Side?” drop down. The new option, called “No Hinge Holes” allows the user to disable hinge holes on a per box basis. This means you can model cabinets with doors, but no hinge holes. This default also, when selected, will permit the “Insert a Door” tool to add a door without hinge holes when using the cabinet’s stored defaults. See image below

The image shows a software dialog box titled "Box Number 1". It contains several input fields and dropdown menus. The "Override Default Hinge Side?" dropdown menu is open, showing options: "No", "Left", "Right", and "No Hinge Holes". The "No Hinge Holes" option is highlighted in blue and circled in red. Below this, there are sections for "Divided Base Options" and "Per Box Materials". The "Divided Base Options" section includes a "Fixed Shelf Offset" field and six "Position" fields, each with a "Fixed Shelf" dropdown. The "Per Box Materials" section includes a table with columns for "Assembly", "Material Type", and "Material Name". At the bottom, there are "Cancel" and "OK" buttons.

Assembly	Material Type	Material Name
Sheet Goods.	Sheet Good	Maple Plywood - Pre-Finished
Trim & Banding.	Rough Lumber	Maple

- Changed the Divided Upper and Divided Base to draw doors and drawers automatically by on user inputs in the Divided Box dialog box. Note the changes in the Box Selector and Modify Box Selector dialog boxes and the new Divided Box dialog box at the top of the next page.

The user now has 15 compartments to define. Each time the ‘Select a box type.’ Dropdown is selected to Divided Base (or Divided Upper) the Divided Box dialog box (right image) opens. The user must complete the Divided Box and press OK before going to the next box using the Next button on the Box Selector (or Modify Box Selector) dialog box (left image). The values in the Divided Box dialog box, at the top of the next page on the right, produced the left box in the cabinet at the top of the following page. Note that the user no longer needs to use the Insert a Door and Insert a Drawer tools.

- Changed the None Hatch to white from gray.

- Moved the Fixed Shelf Offset parameter from the Base Cabinets tab to the Carcass tab in the Shelves section. This is to reflect that this parameter is used in both Divided Upper and Divided Base boxes. Also changed the default from 0" to 5/8".

9. Added a new tool called Move Cabinet  and Move/Copy Cabinet. As the icon suggests, what it actually does is accepts two endpoints from the user. Both points must be on a construction line. The initial point is interpreted as the new starting point for the moved or copied cabinet. The second point can be any distance from the initial point and is interpreted as the direction (a vector) the moved or copied cabinet will be drawn. The Ctrl key (Option key on the Mac) will toggle Move and Move/Copy, indicated by the presence or absence of a + sign on the cursor.

Fixes

1. Disconnected the Offset input field in the Divided Base Options and Divided Upper Options sections of the Box Selector and Modify Box Selector dialog boxes from Mid-Stretchers. Also rename Offset to Fixed Shelf Offset. The result is that Fixed Shelf Offset only applies to Fixed Shelf(s), not to Mid-Stretchers. This solved a problem with pockets being drawn incorrectly in upper divided cabinets and the mid-stretchers being placed incorrectly in both base and upper cabinets.

In addition, changed the Component Type for Fixed Shelf from Bottom to Shelf, which changes its CutList Bridge attribute. Lastly, on the CNC Setup tab, changed the default Shelf/Fixed Shelf in the CNC Milled Faces section from Bottom to Top. These two changes permitted the correct DXF drawing of mid-stretchers; specifically it permitted the drawing of the rabbets on the tongues.

2. Fixed a problem with the Insert a Drawer tool. If the top rail is drawn, and the user tries to insert a drawer that touches the top rail, the drawer opening is incorrectly calculated, making the selected drawer box height less than it should be.
3. Fixed a problem with Edit Cabinet. If, for example, a Standard Base w/Drawers is drawn with two doors and two drawers, and subsequently the Edit Cabinet tool is used to edit another aspect of the cabinet, the doors and drawers would revert to one door and one drawer, even though these parameters were not changed. This was due to the asynchronous nature of the HTMLDialog causing a code race condition.
4. Fixed a problem with an uninitialized class instance variable. If the user just completed editing a divided upper cabinet using Edit Cabinet, and followed that by editing any non-divided upper cabinet also using Edit Cabinet, any box number greater than 1 would be interpreted as a divided upper even though its DNA says otherwise.
5. Fixed a problem with Divided Upper and Divided Base where the wrong set of defaults could get selected when using the Insert a Door tool. This would only occur when the selected rectangle touched more than one box and when the user was queried about the wrong box first.
6. Fixed a problem where drawer boxes in Divided Upper cabinets were mistakenly placed on the Upper Drawer Fronts layer instead of the Upper Drawer Boxes layer.
7. Fixed a problem with a bug crash would occur on the Mac when drawing a Divided Upper or Divided Base.
8. CabWriter Software LLC's website is now a secure site. Hence its new URL is <https://www.cabwritersoftware.com/>. This change required a code change because it produced errors when trying to activate a license.
9. Fixed a problem that occurred frequently with models using inset joinery. The problem occurred seldom on models that did not use inset joinery, though it sometimes could. The typical error message was "The model appears to contain a component with a missing face."
10. Fixed a problem that restricted DXF output to 100" (2540 mm) long sheet goods. Now the user's model can call for 150" (3810 mm) long sheet goods. This is intended to allow use of 12 foot sheet goods or its metric equivalent.

11. After an error message, SketchUp was sometimes left in a state that required a tool such as the Line tool to be used before the Select tool could be chosen. Now, after an error message, the Select tool is automatically chosen.

12.
